Online dating and gaming with avatars have merged in the new phenomenon of avatar dating. Since online dating is a big and growing industry, gaming technology is still advancing rapidly, and avatar dating is popular with young players, the phenomenon is likely to grow in importance in future. This paper explores the advantages and disadvantages of this new form of dating and relates the findings to previous work in social psychology.

In Hindu tradition, the old Sanskrit term *avatāra* (meaning “descent”) denoted the incarnation of a deity. More recently, the notion of an avatar has become a prominent part of post-modern culture. Since the first appearance online in 1985 of the beta version of a role-playing game invented by Chip Morningstar and Randy Farmer called *Habitat* [13], the term *avatar* has come to denote the screen representation of an online gamer. In this new incarnation of the term, the gamer uses the mouse and keyboard, or a joystick, to control the movements of an animated screen figure that represents the gamer. The animated screen figure is the avatar.

1 Paper delivered on the panel Shaping virtual lives: identities on the Internet, during 10th Congress of the Société International d'Ethnologie et de Folklore (SIEF), Lisbon, April 17-21, 2011.
Since that time, thanks to science-fiction authors such as William Gibson [9] and Neal Stephenson [18], as well as multitudes of online gamers (e.g., players of massively multiplayer online role-playing games, a.k.a. MMORPGs), the career of the new incarnation of the term has taken off. Now millions of online producers and consumers of video clips, mobile applications, social forums, and instant messaging services have avatars and have learned to recognize and appreciate the avatars their online peers deploy.

Global stardom for the new concept came in 2009 with the eponymous hero (also known as Jake Sully) of James Cameron’s blockbuster movie Avatar [2, 16]. The virtual tribe of avatars was fruitful and multiplied in cyberspace, both in the form of the computer-generated three-dimensional action figures used to represent gamers in computer games and as the expressive two-dimensional icons (portrait photos and cartoon icons) that participants use to represent themselves on web forums and in other online communities. As avatars grew more prominent and pervasive on the Internet, it was inevitable that people would begin to use them for online dating.

Independently of the avatar story, online dating services first appeared in 1995, when the American corporation Match.com opened for business. Now the online dating industry has grown to include well over a thousand lifestyle and dating sites together with innumerable niche sites pairing people by race, sexual orientation, and religion, or offering online social contacts within specific circles (so finely sliced and diced as to cater just for women behind bars, or smokers and marijuana users, or Star Trek fans, to cite a few freely chosen examples). In the USA and UK, the online dating industry is the highest grossing online industry after video games and digital music. The eighth Internet Dating Conference, in Miami in January 2011, brought together business executives from over 500 companies involved in online dating. Most of the sites these companies run encourage their members to upload photos of themselves together with their profiles and browse the photos of other members [11]. The members then exchange mail and other online data to their hearts’ content, or until they feel moved to go to the next level and meet in the flesh. On the biggest dating sites (e.g., eHarmony, Match.com), the machines do the matchmaking one-to-one, in social isolation [5]. By contrast, on social networking sites such as Facebook (now with over 500 million members and still growing fast) or the company formerly known as MySpace (which once had over 100 million members) a community approach limits the intimacy of personal exchanges and enforces a keep-it-clean policy for any postings that other members of the online community can access. For this reason, much of the social interaction is not dating but rather public flirting: “although the social networking sites appeal mainly to young users and are not strictly dating sites, they bring the community back into whatever dating is
generated there” [15]. When your friends can read your posts, you’re not likely to start getting as intimate as you are when you think you’re alone with your date. But in either case, social or one-on-one, the interactions are mostly via text.

In parallel to this development, software developers in the more geeky world of computer games created ever more addictive games based on 3D avatars, such as Second Life, invented in 2003 by Linden Lab, a financial giant hosting more than 20 million users (called residents) and IMVU (Instant Messaging Virtual Universe) founded by Will Harvey in 2004 [10]. IMVU is a 3D graphical instant messaging client with over 90 million registered users and 6 million unique monthly visitors. To give a sense of the scale of such businesses, IMVU currently generates approximately $2 million in revenue per month, 90% of which comes directly from the sale of virtual goods. In recent years, these technically more sophisticated games have popularized avatar dating within their virtual world, where the screen avatars do all the things virtually together that their owners would perhaps like to do for real with each other in the physical world. Thus online dating developed to the next level [7].

Virtual dating combines online dating with online gaming. Virtual dating involves people using their avatars to interact in a virtual space that resembles a real-life dating environment, complete with photo-realistic 3D avatars and scenic props, where they can listen to music and play various games that provoke online conversation between the people behind the avatars. For example, in Second Life individuals can meet, chat, and flirt in a romantic virtual café in a city, such as New York, Paris, Cracow, or a tropical island resort. They can eat and drink in a virtual restaurant with their animated date, even though in reality the users are relaxing at home in their pajamas, with no more than their mouse and keyboard to keep them busy and no risk of ruining their best outfits or succumbing to the temptations of too many gourmet calories. The animated screen dolls do all the usual human work of building up a relationship. They react to each other’s every move, they gesture and speak at the whim of their owners, and when the date is done they even kiss goodbye, if the proceedings went as well as the pair of dreamers behind the avatars had hoped. The avatars perform these ritualized mating games amid meticulously optimized atmospherics, where the streets and sidewalks are always clean and free of undesirable drunks or vagrants, the females are absurdly beautiful and unnaturally receptive, the males are impossibly handsome and clean-shaven, and any date can end in torrid sex where the partners keep going to unreal extremes. A user can often equip his or her avatar with an extensive array of pornographic accessories, and if the user is still bored or feels that the body image or persona or outfit is insufficiently alluring there is always the option to revamp everything with an instant virtual shopping expedition, for example, for a bigger bosom.
or a bolder dress or more muscular shoulders or a smarter suit. If you have an appetite for the best caviar and want to send a hundred roses to your avatar date, you can indulge your whim with artificial money, which is always available at a very reasonable exchange rate, all calculated, naturally, to maximize the revenue the online dating agency can generate from the user’s real money. Naturally, too, the customers driving the avatars in their romantic escapades find their own hedonistic impulses escalating in their avatar world where the usual physical limits are replaced by virtual infinities, and human greed for unlimited consumer goods can drive the customers to become more and more addicted. All the while, the dating site’s proprietors and their associates in all the subsidiary businesses that grow like mushrooms around these sites smile with joy as they watch the revenues accumulate in their bank accounts.

While even the technically less adventurous online dating sites allow members to select their partners on the basis of attributes such as education, income, and exact geographical location, avatar dating allows users to explore each other much more intimately for such attributes as compatibility of character, sense of humor, liking for fun, and emotional rapport, all of which enables the members to develop substantial friendships and satisfying relationships with people from anywhere in the world, people whose real names and faces they need never encounter. Moreover, most 3D social games offer special premium membership, allowing those prepared to pay for the privilege to enjoy all sorts of sexual acts between their avatars. This freedom stands in evident contrast to that on offer in the usual social networking applications, such as Facebook, where a wholesome moral code prevails and nothing pornographic is allowed on the sites. But even the premium freedom is only a start. Any member can decide one day to make the transition from virtual shenanigans to the less exotic pleasures of more realistic dating online, with sharing of real names and photos of real faces and bodies, or even to go the whole hog and start dating offline.

Once you have experienced the virtual delights of avatar dating in an online venue, taking that last fateful step and going for a real, physical, face-to-face meeting with your avatar date can only be a let-down. On the screen, your date was always radiant with surreal beauty, in a fashion-model world where the women have wide eyes and curvaceous bodies, full lips and flawless complexions, and the men are tall and well muscled, with full heads of hair, smooth chins and impeccable tans. Before your first date in the physical world of everyday life, you wore Seven Mile Boots and met your date in a virtual paradise. Your avatars met in luridly colored landscapes featuring flower-framed waterfalls and endless beaches sloping into turquoise seas, where after a drip-dry splash in the waves the pixel-perfect pair drive in a luxury limousine to a colorful restaurant serving dishes that look perfect but taste of nothing at all.
However you personalized your online experiences, your virtual dates were mere chapters in a fairy tale jazzed up with pop-culture clichés. Worse, on most dating sites your fairy tale was far from free of charge: you had to pay by the hour, the week, or the month, for your virtual dates and for all the virtual enhancements to the avatars and their circumstances that made those dates so special in your fading memory. Whether you liked it or not, you paid for the kitsch artistry the web designers used to trick up your animated world, for the aesthetics of avatar dating are that of Barbie and Ken and similar products, styled to appeal to the lowest common denominator to lock in the profit margins. Perhaps this only reflects modern offline life, where local color becomes ever more diluted in the globalized styling of goods made in China.

Your online dates were limited in other ways too: to keep the software programming task within bounds, the avatar exchanges that made up your conversations with your date were probably selected from a predefined set of distinctly limited questions and answers, where you clicked on the least boring conversational gambit to take your avatar date another step forward and hopefully began to build up a meaningful picture of the likes and dislikes of the person behind the mask. At least one advantage of all this pointing and clicking will appeal to the fastidious dater: if you don’t like your date you can end the encounter instantly, painlessly, and move on to another avatar with another driver. Those unpleasant feelings you call forth in your date by rejecting them so summarily are safely hidden behind a remote screen.

All this state-of-the-art interactivity in virtual dating space has been possible since 2008, thanks to the pioneering efforts of Dave Wilkie and Stefan Embleton on their virtual dating site Weopia (which is based in Canada) [23]. The innovation was quickly replicated by OmniDate, AvMatch, RED Virtual Date, and others. Unlike the innovators behind Second Life, these new pioneers foresee that their avatar dating system will be used by real people who want to set up real-life dates with their screen companions in the fullness of time. The sites offer their services simply as a way of going on a virtual first date and recommend it as less time consuming, less expensive, and less hazardous than meeting at a local venue where anything and everything can go wrong.

Enthusiasts for the technology of virtual dating emphasize the ultra-cool software behind the scenes. The programs offer unprecedented opportunities to establish deeper yet safer understanding with your online partner through mutual exploration in fantasy worlds, shared fun playing games you both know and enjoy, and digitally enhanced insight into your date’s character and likeability. They are the best way known to geeks of preventing disappointment on your first date in the real world. Reasonably enough, the advocates point out that virtual dating is much more friendly to women than, say,
online dating based on web cameras or telepresence technologies that break through the wall of fantasy and pose a real danger of stalking and similar real-world problems.

Virtual dating apparently has the most appeal for teenagers, though older punters (in their 20s or 30s) are numerous enough too on the more popular sites. But older users are rare indeed; they prefer the more old-fashioned and serious online dating sites where prospective partners are encouraged to post real photos of themselves accompanied by detailed and fact-laden profiles. For people beyond the first flush of youth, online dating is evidently a serious business, where the ticking of the biological clock takes all the fun out of fooling around in cloud cuckoo land. This merely reflects the facts in real life, where biologists and psychologists agree that there is no mystery as to why the most active daters, sexually, emotionally, and socially, are young people looking forward to a full life together with their new partners that will flower into children and all the rest. As to the fantasy side of avatar life, where multiple identities are almost the norm and nothing is quite as it seems, young people in real life too are often searching for their own identity and eager to try any new trick to help understand themselves a little better, even at the risk of a few bumps and bruises along the way.

People on virtual dates often project whimsical or distorted forms of themselves into the digital outlines of their avatars. These forms might somehow symbolize a real aspect of the personality of the user behind the mask, or they might just be a witty upside-down creature, but generally we can expect them to be a projection of a desired image (to be sexier, thinner, bolder, or stronger) inspired by pop culture stereotypes and ideals set by the latest celebrities. Complementing that choice, we can also expect that the avatars people choose to date in their romantic games reflect what the players themselves find attractive in the opposite sex (at least for heterosexual games – other players might prefer to play gay games in the safety of their online bubble worlds). The personal preferences we can expect to observe will go together with the ambitions of the players to be admired or desired, not only physically but also socially and mentally. The basic drive behind any virtually enhanced dating behavior is wishful thinking – to be more intelligent, more witty, more experienced, more appealing, more blessed with social graces, and more attractive in general. Naturally, this drive animates not only online dating but also dating in the flesh, the traditional way, where the participants always plan the early steps obsessively to optimize the first impressions they make, but in the virtual case the brakes are off. It seems almost churlish to spurn the opportunity to incarnate oneself as a more amazing and more fabulous creature than one ever could in traditional online dating. In that world, even photos that have been painstakingly enhanced in Photoshop and résumés and profiles that have been edited and optimized to the point of untruth can do little to hide the facts of biology and economics. Given the
point of traditional online dating, which is to smooth the transition to a physical date with a face-to-face meeting, there is little point in overdoing the creative input. By contrast, in all-out 3D avatar dating the residual link to everyday reality is so tenuous as to be negligible. Why not have fun and pretend to be Angelina Jolie and Brad Pitt for a day? The avatars are play-dolls, and the wilder and wittier the play the better, so long as the players remember that their multiple identities are free creations of the human spirit, constrained only by the frames and the aesthetics offered by the site designer. Seen in this light, avatar dating is decoupled from its origins in human mate selection and becomes a sport or pastime in its own right, like tennis or Sudoku, with the fantasy limited less by the romantic or sexual appetites of the players than by their deeper psychology.

Several sociological and psychological studies have dealt with multiple virtual identities [6, 14, 19, 20]. All of them start out from the idea that when people merge their human identity with the array of virtual prostheses that the avatars provide for them, they become, in effect, cyborgs. As such, they create transcendent selves that rise above their human biology and accept the fusion of human and machine that their online activities presuppose. As people transcend their biology to animate virtual agents in their virtual worlds, they find their relatively simple real identities fragmenting into a multiplicity of partial virtual identities, united by a transcendent self that no longer feels bound by the boring old biological facts of real life. The novelty of the cyborg self is its ability to change its character to suit its virtual circumstances. This brings advantages to the human behind the cyborg, such as the option to avoid face-to-face conversations for people who formerly feared their repercussions or the ridicule they once endured; the ability to express their views and opinions without discrimination or penalization in the case of marginalized or prosecuted groups; or the opportunity to encounter or to stimulate similar ideas among like-minded people. But these advantages are also accompanied by actual or possible disadvantages, such as the fact that many people, once given such virtual freedom, soon become addicted to their virtual lives and lose touch with their roots in physical reality, or the fact that as their online fluency increases they begin to lose their fluency in offline communication, especially in the sphere of social contacts [3, 12, 21].

These psychosocial consequences of cultivating a more and more pervasive online life are brought to fever pitch in virtual dating, where deep human passions are entrained to the exchange of bits and bytes, because their virtual identity becomes of existential importance to the people who rely upon it to find sexual or romantic fulfillment. Those who in human life are timid or lack confidence have the chance at last to recreate themselves as they really want to be in the hope that through their online flirting and
chatting they will succeed at least in experiencing the joys of cybersex and perhaps even in starting an offline relationship in the physical world. In all these endeavors, avatars give their owners the freedom to create their ideal incarnation – or at least give them a handy self, free from the perhaps cloying or oppressive restrictions of the real cultural norms and customs of the world they live in, and offer them a new way to feel and play with all the possibilities they may previously have yearned to explore. It is all too easy to idealize a potential partner in a virtual world, but it also gratifyingly easy to idealize one’s own self there and enjoy a new freedom.

Given all these consequences, both actual and possible, it is only right to point out that many people who thus live out their fantasy lives online start off by finding the whole experience a matter of fun and games but slowly find themselves resenting the reality they left behind. They may even go on to inflict pain, depression, and suffering not only upon themselves but also upon their parents, families, spouses, partners, and friends. The online players who become most addicted need psychological help. On other hand, avatars and virtual realities are quickly becoming invaluable tools in the toolkit of modern psychiatry as effective means to cure phobias and as useful weapons in cognitive therapy for anxiety disorders [8], in both cases because the avatar is an active and steerable representation of the patient embedded in a realistic world. Avatars technology has become an integral part of digital communication for general users thanks to its anonymity, safety, comfort, and easy access [22]. A range of problems arise from the opportunities the technology creates for deception through the use of false identities, for harassment of a victim with unwanted communications, and indeed for infidelity among the devotees of avatar dating, but all these problems existed in one form or another in pre-digital life too.

Before we go on to consider the future of avatar dating and matchmaking, it is worth pausing to emphasize the paradox behind online dating. The popularity of the practice is grounded in a strange fact about human nature: all of a person’s intimate relationships in real life need to be reinforced by close and constant physical contacts in order to survive, which gives the potentially runaway world of the inner passions a strong and effective anchor in everyday being; whereas in cyberspace the hindrance imposed by physical distance is essentially overcome, and at the same time the psychic engagement is made more intense, which causes a positive feedback that reinforces the emotional attachments [1]. Without the massive inertia of his or her physical being, a person’s inner feelings can run riot, causing such an obsession with the online target that things can go badly wrong. On the other hand, the same freedom from inertia can allow mutual epiphanies of the spirit that make life worth living again for those who once despaired.
The paradox is not new to digital media: generations ago it was summed up in the folk wisdom that absence makes the heart grow fonder.

Avatar dating has a lot going for it. In physical relationships, people often hide their true feelings and inner fantasies, their ‘bad’ inclinations and ‘naughty’ dreams, and the harder knocks that the university of life has dealt them, but all these blocks are lifted when they can express themselves through their avatars. Problematic personal features like shyness, social phobias, poverty, physical unattractiveness, traumatic experiences, disability, and other social barriers can all disappear while two people date each other with avatars. These benefits are evidently compelling enough to persuade more and more people to try it. For some it may be a fad, for others it is surely a life-saver.

So the future of avatar dating looks good. People who explore each other through avatars have at their disposal a tool of unprecedented power to cut through the psychosocial barriers that can make dating in the physical world such a pain. As the technology matures and the avatars become more realistic, until we can all live as wholeheartedly in our virtual worlds as Jake Sully did in the movie Avatar, the attraction of avatar dating can only increase. Much as airline pilots today spend most of their training hours ‘flying’ in simulators, so future married couples might spend more time getting to know each other on avatar dates than in the flesh. In any case, the technology is here to stay [17]. It is up to us to make the best of it.

**Avatar**

Hang with me in my MMO  
So many places we can go  
You’ll never see my actual face  
Our love, our love will be in virtual space  

I’m craving to emote with you  
So many animations I can do  
Be anything you want me to be  
C’mon, c’mon and share a potion with me  

Do you wanna date my avatar?  
She’s a star  
And she’s hotter than reality by far  
Wanna date my avatar?  

From the song “(Do You Wanna Date My) Avatar?” [4]
